Political Risk Agent

Source-audited political risk workflow for turning public/live evidence into decision-useful commercial risk outputs.

This dashboard displays saved showcase artefacts only, it does not call Tavily or spend live-search credits.

Current showcase cases:

- UK ETS: regulatory policy into route-level carbon cost exposure
- Hormuz: geopolitical/security risk into transit, delay, reroute or legal-hold decision
- Critical Minerals: strategic competition into production-continuity risk
- Sanctions Trade Finance: sanctions/export controls into transaction approval, escalation, legal hold or rejection
- Cyber Business Interruption: geopolitical cyber and ransomware risk into downtime, notification, insurance and recovery decisions

The dashboard is designed as an expandable case portfolio. Future cases can be added using the same saved-showcase pattern.

How to read this dashboard

Step	Action
1	Start with the decision recommendation.
2	Check the model output and key trigger.
3	Review source caveats and company-data requirements before treating the result as operational.

UK ETS Maritime Expansion: Carbon Cost Exposure

Source-audited political risk workflow converting UK ETS maritime policy into operator-relevant carbon cost exposure, route applicability, risk scoring and review controls.

Risk Medium-High	Confidence 4/5	Sources 8
Cost/voyage £2.8k	Annual cost £866.6k	Coverage 100%

First-Reader Summary

Item	Value
Business problem	UK ETS maritime expansion turns carbon policy into a route-level operating cost for in-scope UK voyages.
Decision supported	Identify route applicability, estimate carbon cost exposure, and decide how to reflect that cost in voyage eco
Evidence-to-output logic	Official policy evidence defines scope and timing; scenario inputs convert fuel burn, emissions factors and U
Company data needed	Route list, vessel fuel burn, voyage frequency, verifier methodology and current allowance price.

Operator Decision Carbon Cost Evidence & Scores Source Audit

Operator Stance

Item	Assessment
Current stance	Treat domestic UK voyages by vessels 5,000 GT and above as in-scope from July 2026, with carbon cost now part of
Risk level	Medium-High
Confidence	4/5
Primary risk	Carbon allowance cost, reporting readiness and margin pressure on in-scope domestic routes
Action bias	Quantify route-level exposure, prepare reporting process and test cost pass-through options
Escalation trigger	UKA price increase, route falls clearly within scope, reporting gap, allowance procurement risk
Scenario trigger	International voyages become part of future UK ETS expansion

Applicability Check

Factor	Assessment	Evidence basis

Route type	domestic / international / scenario	Domestic UK and at-berth emissions are confirmed; inte
Emissions covered	domestic voyage and at-berth emissions	Current confirmed scope is domestic UK voyages and er
Reporting obligation	verified annual emissions report	Verified annual emissions reporting remains required in
Surrender obligation	allowance surrender deadline	Allowances are surrendered after reporting, with transit
Caveat	international routes should be modelled as future scenario unless confirmed	Future expansion consultation exists, but this brief does

Executive Judgement

UK ETS maritime expansion creates a near-term compliance and margin risk for UK shipping operators with in-scope domestic voyages. The rule is confirmed for domestic maritime emissions from vessels of 5,000 GT and above from 1 July 2026, making carbon cost a route-level operating input rather than a long-term policy abstraction.

For the illustrative Liverpool-Belfast Ro-Ro profile, the model estimates a carbon allowance cost of 2,770 per voyage and approximately 866,562 annualised, based on stated fuel, emissions factor and UKA price assumptions. These figures should be treated as decision-support estimates, not final compliance values, until operator-specific fuel burn, verifier methodology and current UKA pricing are confirmed.

Decision Implications

Decision area	Current implication	Required response
Route applicability	Not every route is currently in scope.	Separate confirmed domestic exposure from international scenari
Allowance cost	Carbon cost becomes a recurring voyage input for in-scope routes.	Model route-level margin effect and procurement timing.
Reporting readiness	MRV and verified reporting are operational prerequisites.	Check systems, accountable entity and verifier readiness.
Pass-through	Operators may not fully recover carbon cost from customers.	Test surcharge, contract and pricing options.
Future expansion	International routes may be captured later.	Maintain scenario models without treating them as current obligat

Recommended Actions

1. Confirm scope: classify routes into confirmed current scope, partial scope and scenario-only exposure.
2. Build the calculator into route economics: add carbon cost to voyage approval and route profitability checks.
3. Check accountability: confirm the responsible entity, reporting workflow, verifier process and registry/allowance preparation.
4. Test pass-through: review charterparty, freight and surcharge mechanics for recovering some or all carbon cost.
5. Monitor UKA price: refresh the cost model when allowance prices move materially.
6. Keep international routes separate: model them as future scenario exposure unless later evidence confirms current scope.
